MST Series

Multi-Stage Tensioner

Operation Manual

1. Specifications

MST Regular Models:

Features:

Model	Bolt Diameter	The Min. Length of Thread	The Max. Length of	Working Stroke	Bolt Distance	Max. Load	Outside Diameter	Min. height	
									mm
MST-M30	M30	1-1/8"	62	69	7	66	464	73	276
MST-M33	M33	1-1/4"	66	73	9	72	583	78	295
MST-M36	M36	1-3/8"	75	82	9	77	677	84	326
MST-M39	M39	1-1/2"	78	88	10	83	805	90	360
MST-M42	M30	1-5/8"	83	91	10	89	926	96	357
MST-M45	M42	1-3/4"	87	96	10	96	1091	105	371
MST-M48	M48	1-7/8"	93	102	10	102	1231	110	387

- Disc Spring Return
- Over Stroke Warning Signs
- Mechanical Torque Wrench Operation Device
- Explosion Protection Design
- Counter Device
- Quick Replaceable Puller and Bridge Design

Tips:

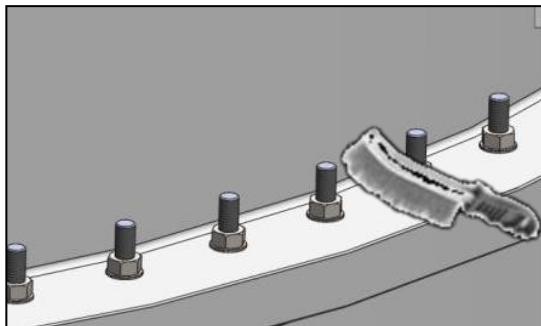

- ✧ The bridge and puller could be different due to different working situations.
- ✧ TRITORC accept customized designs according to customers working situations.

2. Safety Precautions

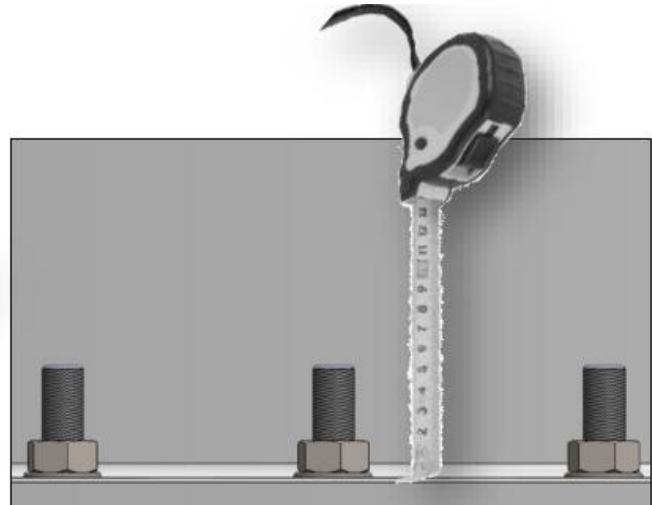

It is dangerous to use high pressure tools, in order to avoid hurting people and damaging tools, please follow the following basic safety recommendations.

1. Before using the hydraulic tensioner, carefully check whether the Tensioner pump, hose, and bolt tensioner are damaged due to improper transportation or storage. If damaged, please dispose it before using.
2. Check the operating data (pre-tightening force, operating pressure) of the bolt tensioner and the bolt (grade, thread length on the nut). The user is responsible for confirming the characteristics, pre-tightening force and connection method of the used bolts.
3. The inner and outer surfaces of the bolt tensioner and the tensioner pump, especially the exposed connection surface of the joint, must be kept clean. They must be cleaned with a special ablent, and then wiped with a clean towel.
4. Inspect whether the oil grade (32 # or 46# anti-wear hydraulic oil) is correct and sufficient. After using, when the oil is insufficient, please fill enough and the correct hydraulic oil.
5. After the work is completed, the pump pressure needs to be reduced to zero.
6. Do not use damaged or unqualified high-pressure hose. Do not use kinked hose. The bending radius of the high-pressure hose should be $\geq 200\text{mm}$.
7. Check the hydraulic circuit before increasing the pressure. Verify that all circuit components are properly connected and check their status. If any problem components are detected, they must be replaced with new components with the same characteristics.
8. During the tightening process, keep away from pressure releasing point. Avoid getting hurt.
9. During the process of pressure increasing, keep a distance of 3-5 meters from the bolt tensioner. Never stand directly in front of the pre-tightening force. The pressure increasing must be carefully monitored by the operator (observed by the pressure gauge).
10. The stroke of the bolt tensioner cannot exceed its maximum value. When the maximum stroke is reached, the mark can be seen on the piston. If the stroke exceeds its maximum value, the bolt tensioner will lose its tension function.

3. CAUTIONS

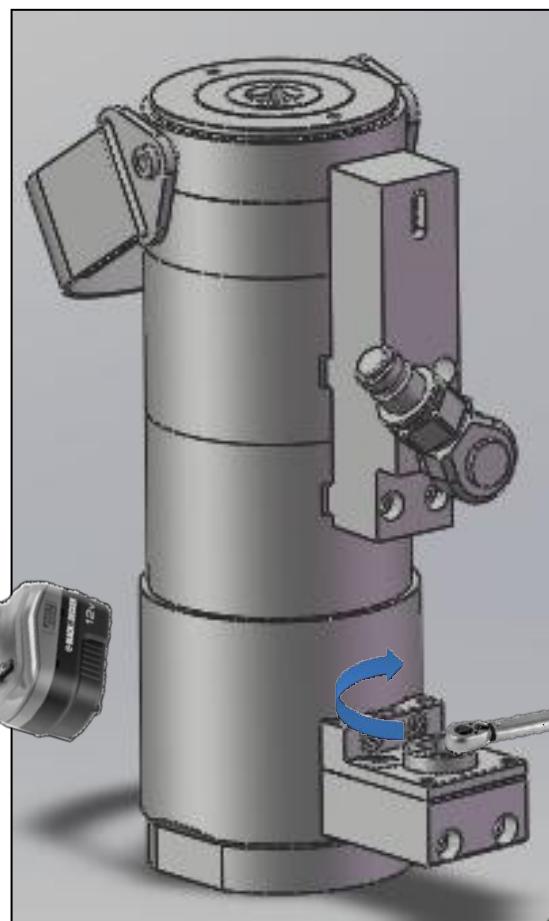

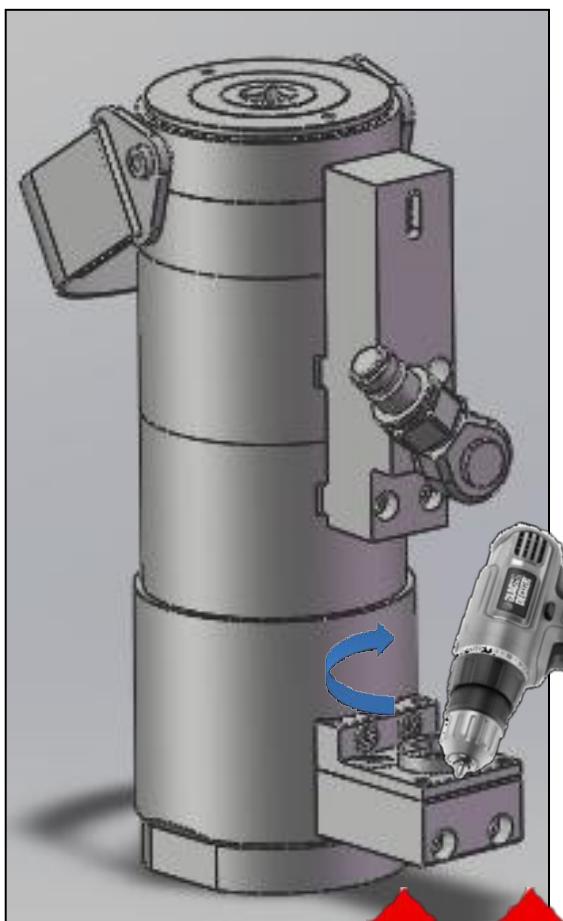

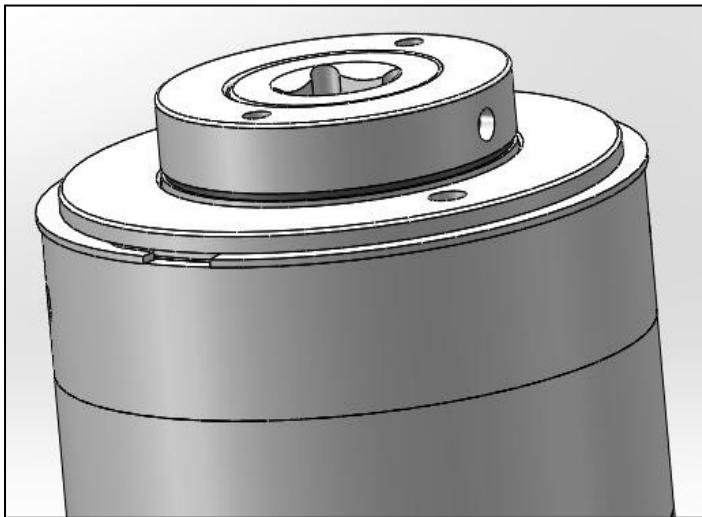

Before operating the tensioner,
please clean the surface and
thread of the bolt

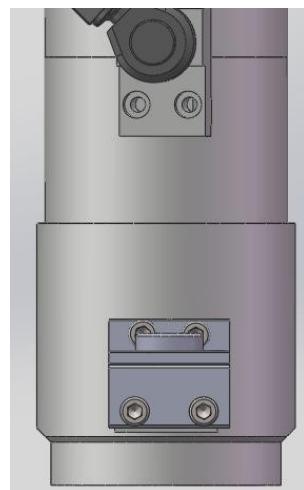

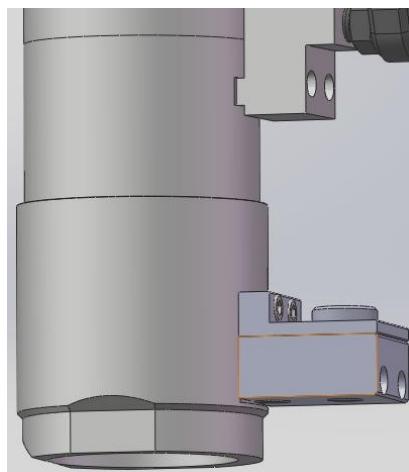

Ensure that there is enough engagement length between
the bolt and the tensioner, but it must be less than the
maximum allowed by the tensioner.

Do not use a battery-driven wrench to turn the gearbox

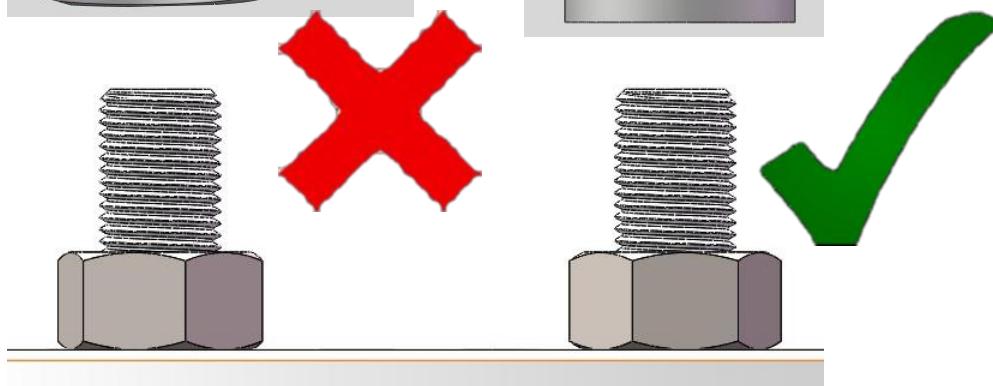

The tensioner stroke cannot exceed its maximum value. See the common specification table of HTE tensioner for stroke parameters. When the maximum stroke is reached, the warning line can also be seen on the piston. If the maximum pressure is reached on this line, abandon the tension cycle. Tighten the nut, release the pressure, and pressurize again.

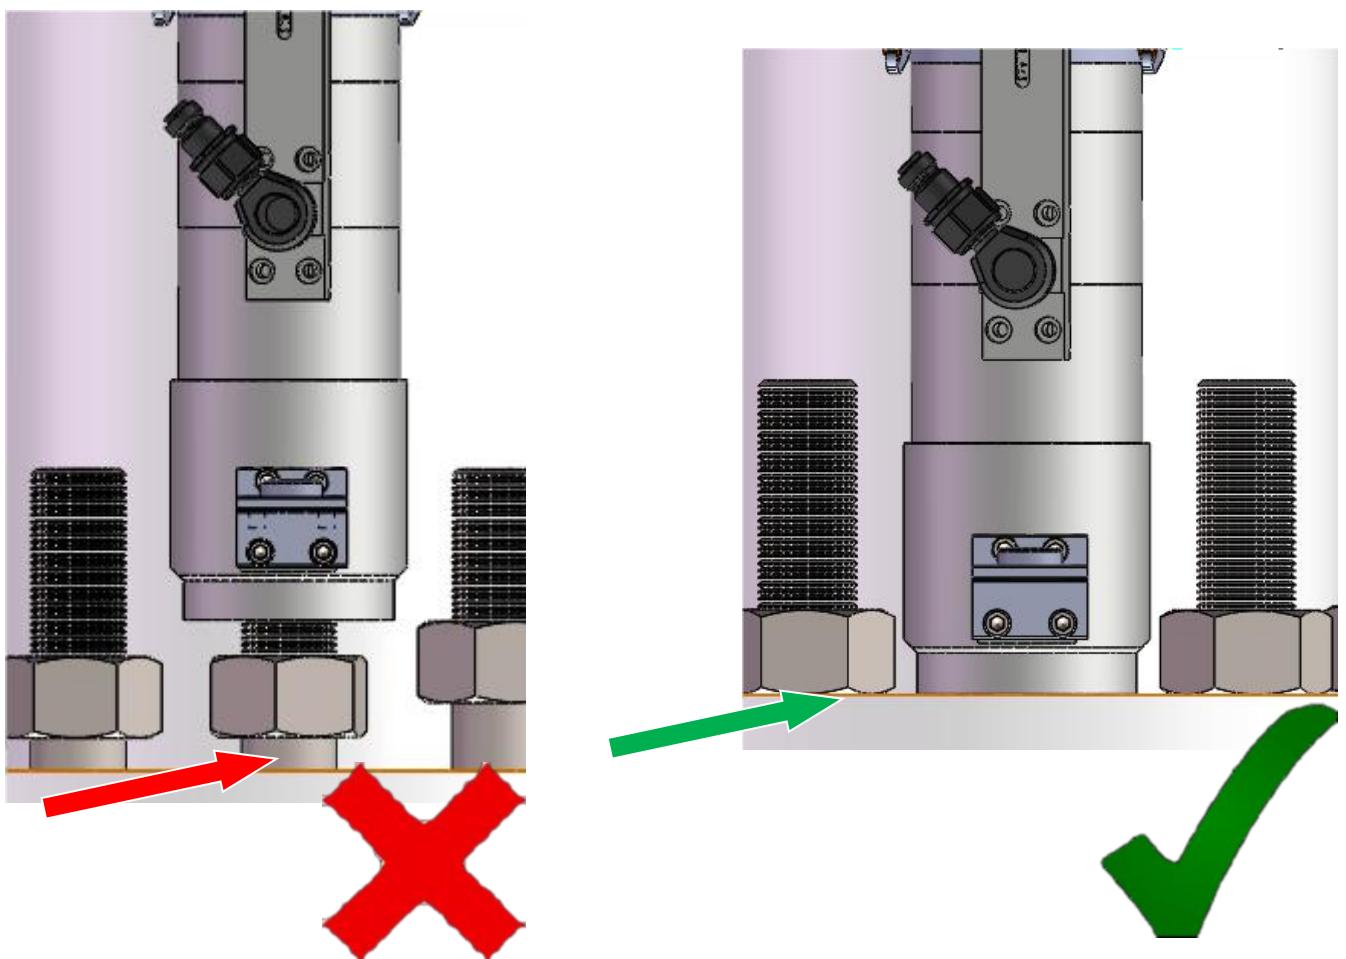

Place the tensioner correctly. Generally, place the gearbox on the front.

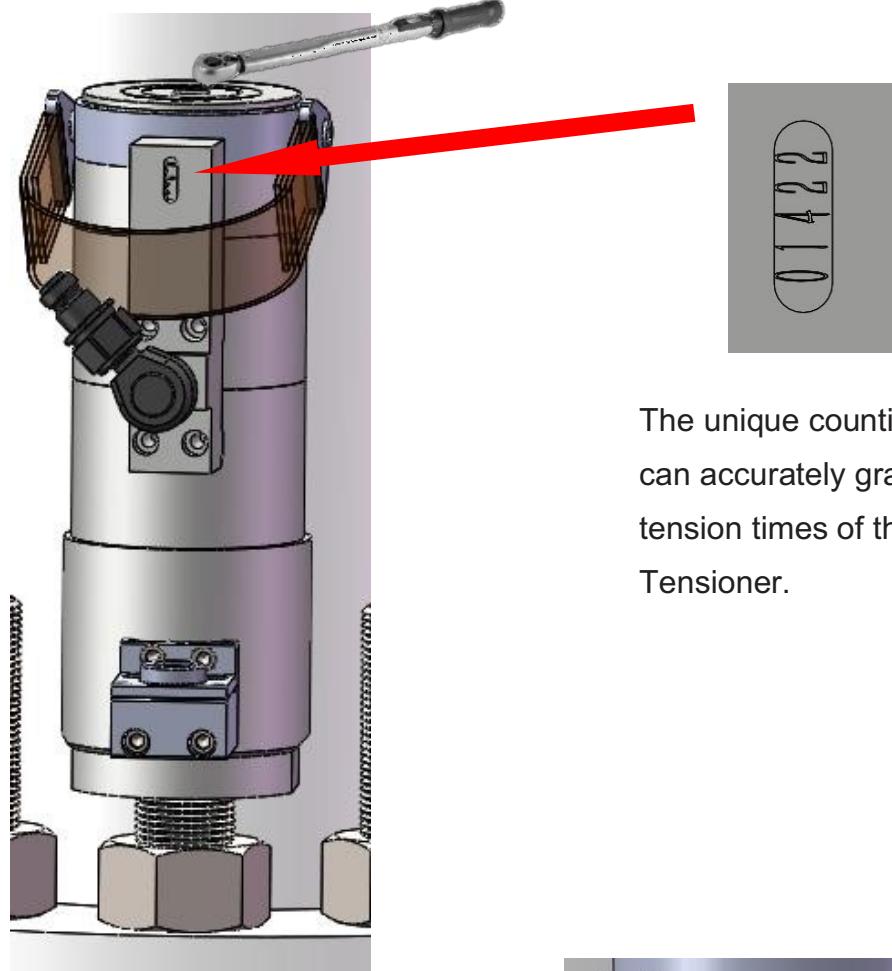

4. Operating Procedure

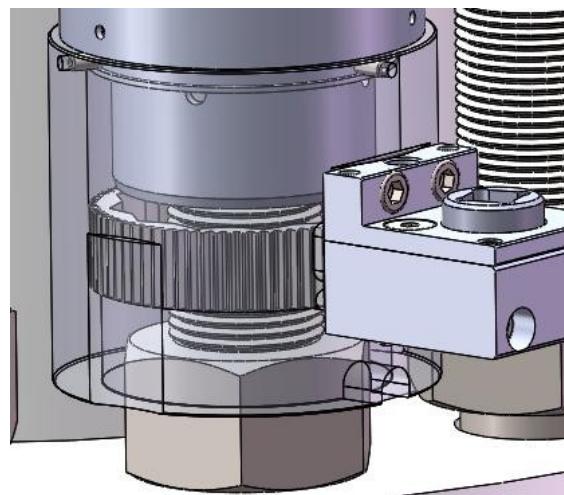

1. Check the load to be applied to the bolt.
2. According to the pressure-load table, find out the pressure required for the corresponding load.
3. Check the effective thread length of the bolt exposed nut to ensure that the height of the bolt is lower than the maximum height allowed by the tensioner under the condition of ensuring the engagement.
4. Tighten the nut onto the flange surface before tension.

5. Screw the tensioner into the bolt with a ratchet wrench. Make sure that the gear sleeve and the nut are properly engaged.

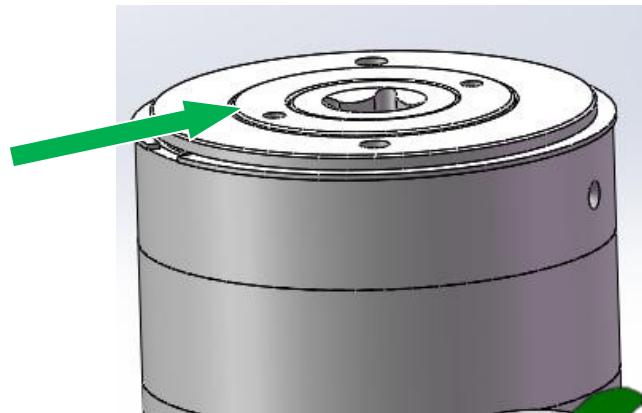

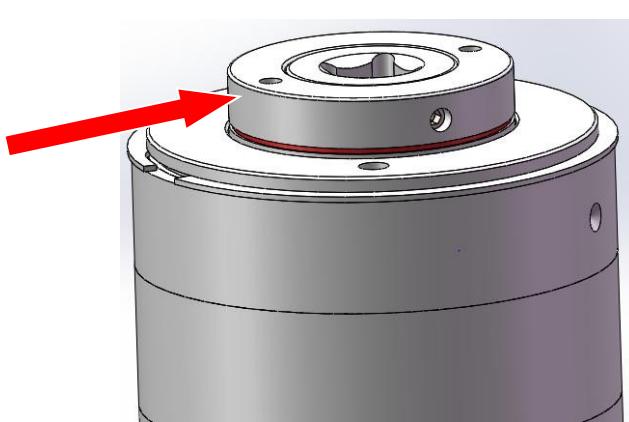

The unique counting design
can accurately grasp the
tension times of the Bolt
Tensioner.

Connect the tensioner pump and the high-pressure hose and start operation.

7. Release the pressure of the oil pump after tightening or loosening the nut, the tensioner will return to position automatically, and the hydraulic oil flows back to the oil pump storage tank. When the piston returns to the initial position (that is, the piston is flush with the cylinder), it is ready to work for next stroke.

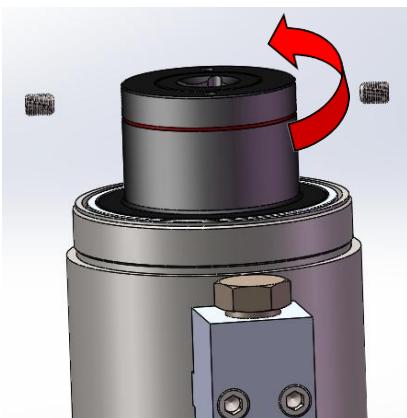

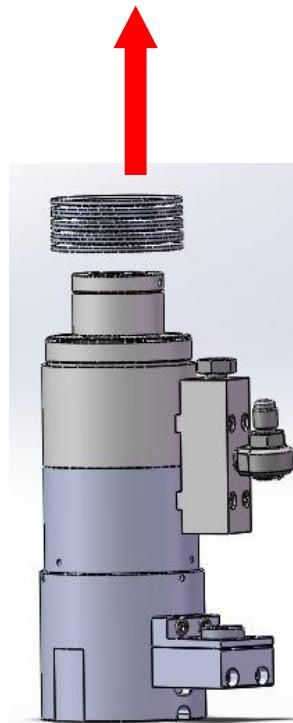

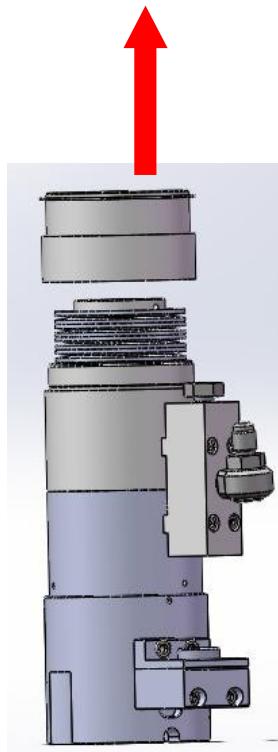

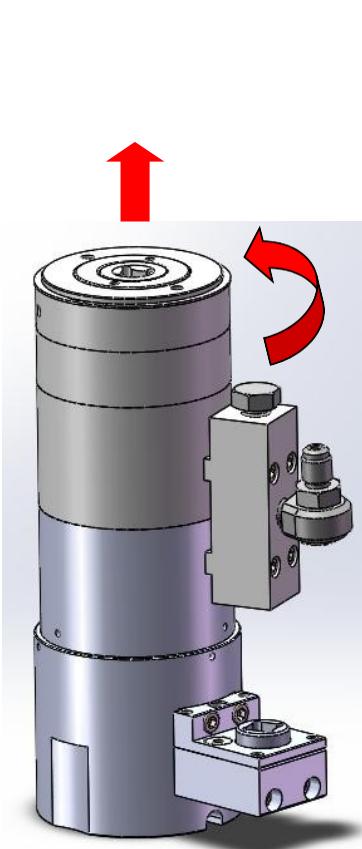

▲ Warning: Before removing the tensioner, make the stroke of the tensioner zero for next time to use.

▲ Note: Please clear the tensioner after using, ensure the tensioner will not get rusted.

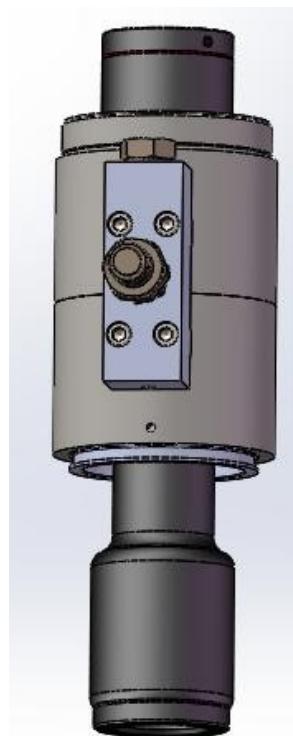

Notice: 1. Please do not disassemble the tensioner without proposal.
2. Do not over-stroked the tensioner.

5. Replace Puller

Remove the topside cap, then remove the disc springs.

Remove the set screw,
then loosen the lock nut.

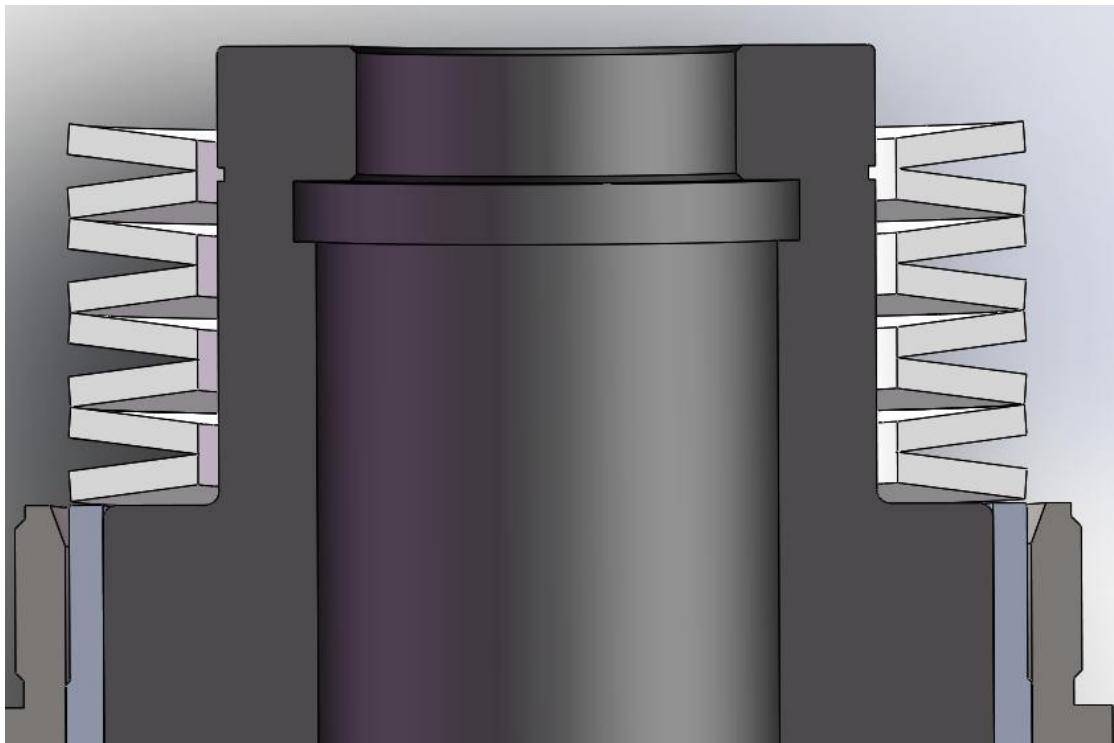

After removing the bridge
and protective cover, the
puller can be replaced as
needed.

Pay attention to the direction when assembling the disc spring, as shown in the figure below:

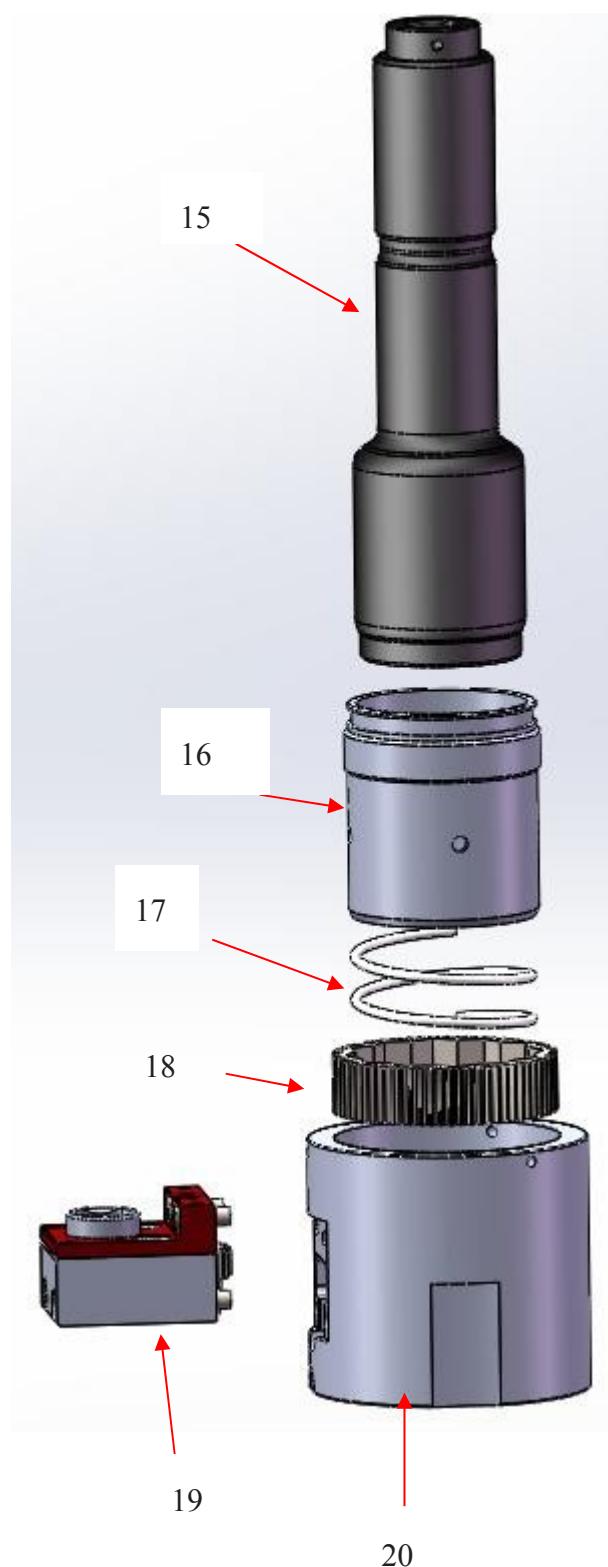

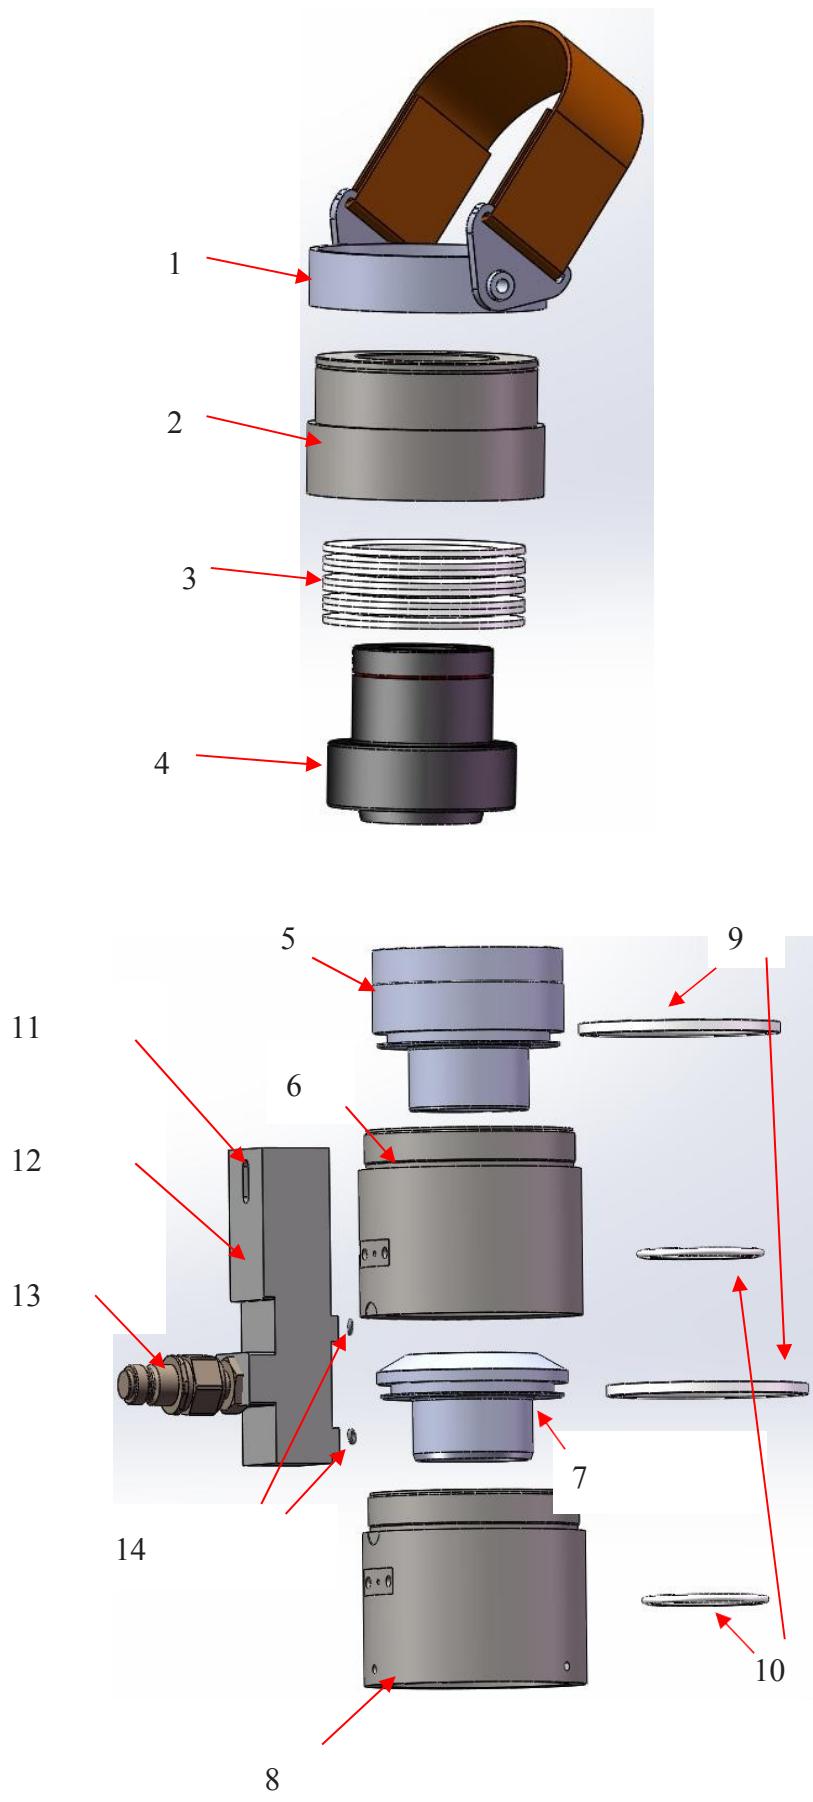

The disc springs need to be placed in opposite directions alternately; please note that the opening of the bottom disc spring faces downwards →

6. Troubleshooting Guide

Trouble	Reason	Solution
Leakage at connecting block and joint	The connection block is damaged or the joint connection is loosen	Re-tighten the connection block correctly, if the leakage continues, replace with a new connection block
Leakage at the connection between the connecting block and the cylinder	The seal is broken or the screw is loosen	Tighten the connecting screws, if the leakage continues, replace the seals
Leakage at the piston	The seals are broken or the mechanical part is damaged	Stop using the tensioner, contact supplier for repair
The piston cannot recover	There is pressure inside the cylinder	Reconnect the coupler, release the inner pressure
The puller is not compatible with the bolt	The puller is damaged or does not match the bolt specification	Change the puller
The tensioner cannot work	Continue to pressurize after the puller reaches the maximum stroke	Lock the puller through the gear box first, then reset the correct working pressure
	The tensioner reaches the maximum load	Make sure the load is enough for the application, if not, change for the suitable tensioner
